

This fixture verifies the bundled liteparse PDF parser inside the packaged desktop client. The install tree ships runtime/parsers/lit/lit.exe together with pdfium.dll, and the shell writes LITEPARSE_BIN into client.env so the worker can invoke it for local PDF ingestion. A healthy parse extracts this text layer into markdown blocks without any OCR service. If this document fails to reach completed status, the bundled parser provisioning is broken and the failure must surface here instead of on a user machine. The quick brown fox jumps over the lazy dog while packing my box with five dozen liquor jugs.
